

DLX

Line Differential Protection IED

***Complete and flexible
protection for overhead
and underground lines***

***Designed for installation in reduced
spaces***

***Combines with external IEDs for
flexible architecture***

***Easy integration using standard
protocols: IEC870-5; DNP3; ModBus
and IEC61850***

Contributing to improve safety, quality of service and profitability of electrical systems

Functions

- 87L Phase Line Differential
- 87N Neutral Line Differential
- 87Q Negative Sequence Line Differential
- 87P Phase Directional Comparison
- 87PN Neutral Directional Comparison
- 87PQ Negative Sequence Directional Comparison
- 50 Phase Instantaneous Overcurrent (3 units)
- 50Q Negative Sequence Instantaneous Overcurrent I2 (3 units)
- 50N Neutral Instantaneous Overcurrent (3 units)
- 50Ns Sensitive Neutral Instantaneous Overcurrent, with Independent Analog Input
- 51 Phase Time Overcurrent (inverse/definite) (3 units)
- 51Q Negative Sequence (I2) Time Overcurrent (inverse/definite) (3 units)
- 51N Neutral Time Overcurrent (inverse/definite) (3 units)
- 51Ns Sensitive Neutral Time Overcurrent (inverse/definite) (3 units), with Independent Analog Input
- 67 Phase Directional Overcurrent
- 67N Neutral Directional Overcurrent
- 67Q Negative Sequence Directional Overcurrent
- 67Ns Sensitive Neutral Directional Overcurrent
- 85-67 Overcurrent Protection Schemes
- 27 Undervoltage with Selectable Line or Phase Voltage Input (3 units)
- 59 Overvoltage with Selectable Line or Phase Voltage Input (3 units)
- 59N Neutral Overvoltage (2 units)
- 81M Overfrequency (4 units)
- 81m Underfrequency (4 units)
- 81D Frequency Rate of Change (4 units)
- 79 Recloser
- 25 Synchrocheck by voltage, phase, and slip
- 49 Thermal Image
- 50BF Breaker Failure
- 27WI Weak Infeed Logic
- 46 Phase Unbalance I2/I1 (Current Reverse Phase)
- 27DL Dead Line Detector
- 3 Breaker Coil Circuit Monitoring
- 2 Pole Position Checking
- FL Fault Locator

DLX

Description

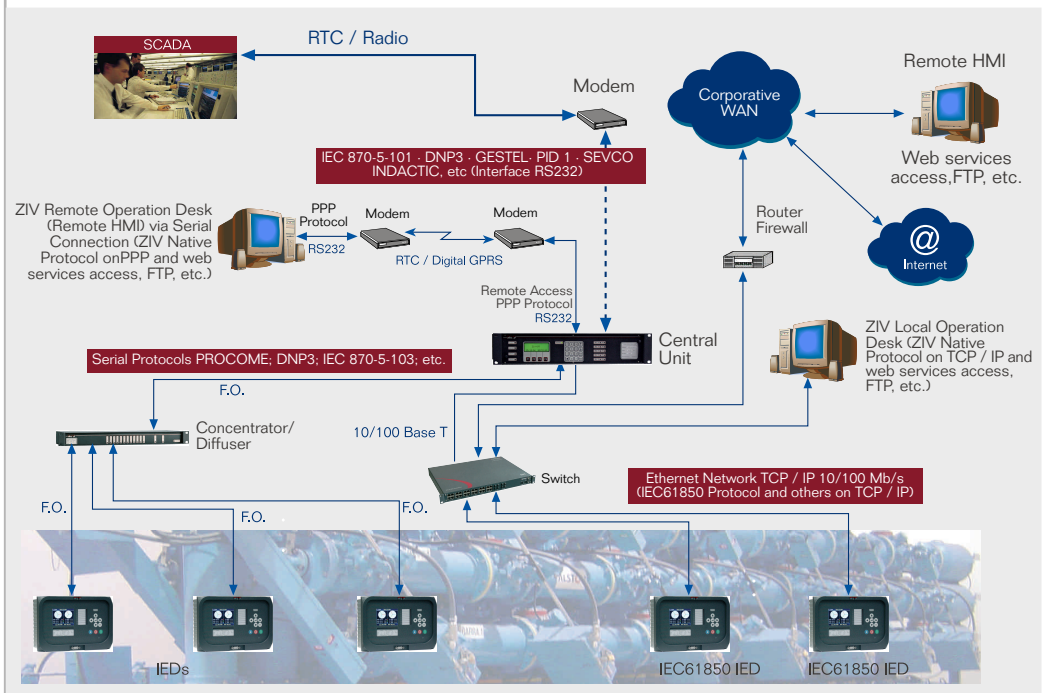

The **DLX** design provides an integrated and complete solution for protection, control, and metering for overhead lines and underground cables.

The included programmable module allows users to define the operation logic for both protection and control functions, according to the requirements of each application.

An easy to use communication and programming toolset complements this IED line, providing a user friendly environment to define applications.

The DLX models provide complete protection for lines and cables, also incorporating control logic.

The DLX is equipped with two types of communication ports. One type connects the unit with the remote end, exchanging digital and analog signals required by the protection functions and any other user programmed logic. The second port type is for the remote interface, one for protection functions and one for control connectivity.

Each port is connected to its associated network, managing each subsystem independently by the corresponding upper level. Such architecture supports different communication protocols for each case if required.

Application

ZIV model **DLX** is designed to provide selective, fast, and reliable protection for overhead lines and underground cables.

DLX models include a complete set of protection functions to cover every application requirement. Complementing the protection functions, the unit includes control functions that support commands, logic, and metering both from measured and calculated parameters.

The versatile communication structure makes the units an optimal solution for stand alone applications and integrated systems, either conventional or based on the **IEC61850** standard.

The **DLX** modular construction and reduced size are specific design requirements for applications in distribution switchgear and metal clad applications.

 *The DLX modular design drastically minimizes panel wiring.*

Protection Functions

Phase Differential Unit

The **DLX** includes a segregated phase differential unit with dual slope percentage restraint characteristic, compensating the different CT ratios, and including a capacitive current compensating algorithm to provide optimal sensitivity on cables or very long overhead lines.

Neutral and Negative Sequence Differential Units

These units allow increasing the relay sensitivity for internal faults with low current contribution that may not be detected by the phase differential unit.

Phase, Neutral and Negative Sequence Directional Comparison Units

The directional comparison units complement the differential units providing security against external faults with saturation in any of the CTs without the need to reduce the differential sensitivity.

Fault Detector

The detector monitors the differential unit trip with an independent principle of operation, providing increased security against problems in the communication channel.

Enhanced Fault Locator

The fault locator utilizes current and voltage information from both line ends, obtaining more precise results than locators using only local information.

Single Pole / Three Pole Trip Logic

The **DLX** unit is capable of generating single pole trip commands for single phase faults. The differential and the overcurrent neutral and negative sequence units are able to issue single pole commands based on the fault type selector algorithm included.

Additional Functions:

The **DLX** includes overcurrent, over/undervoltage, thermal image, frequency elements, and open phase units. These protection units can be set as backup to the differential units, operating if a communication channel failure is detected.

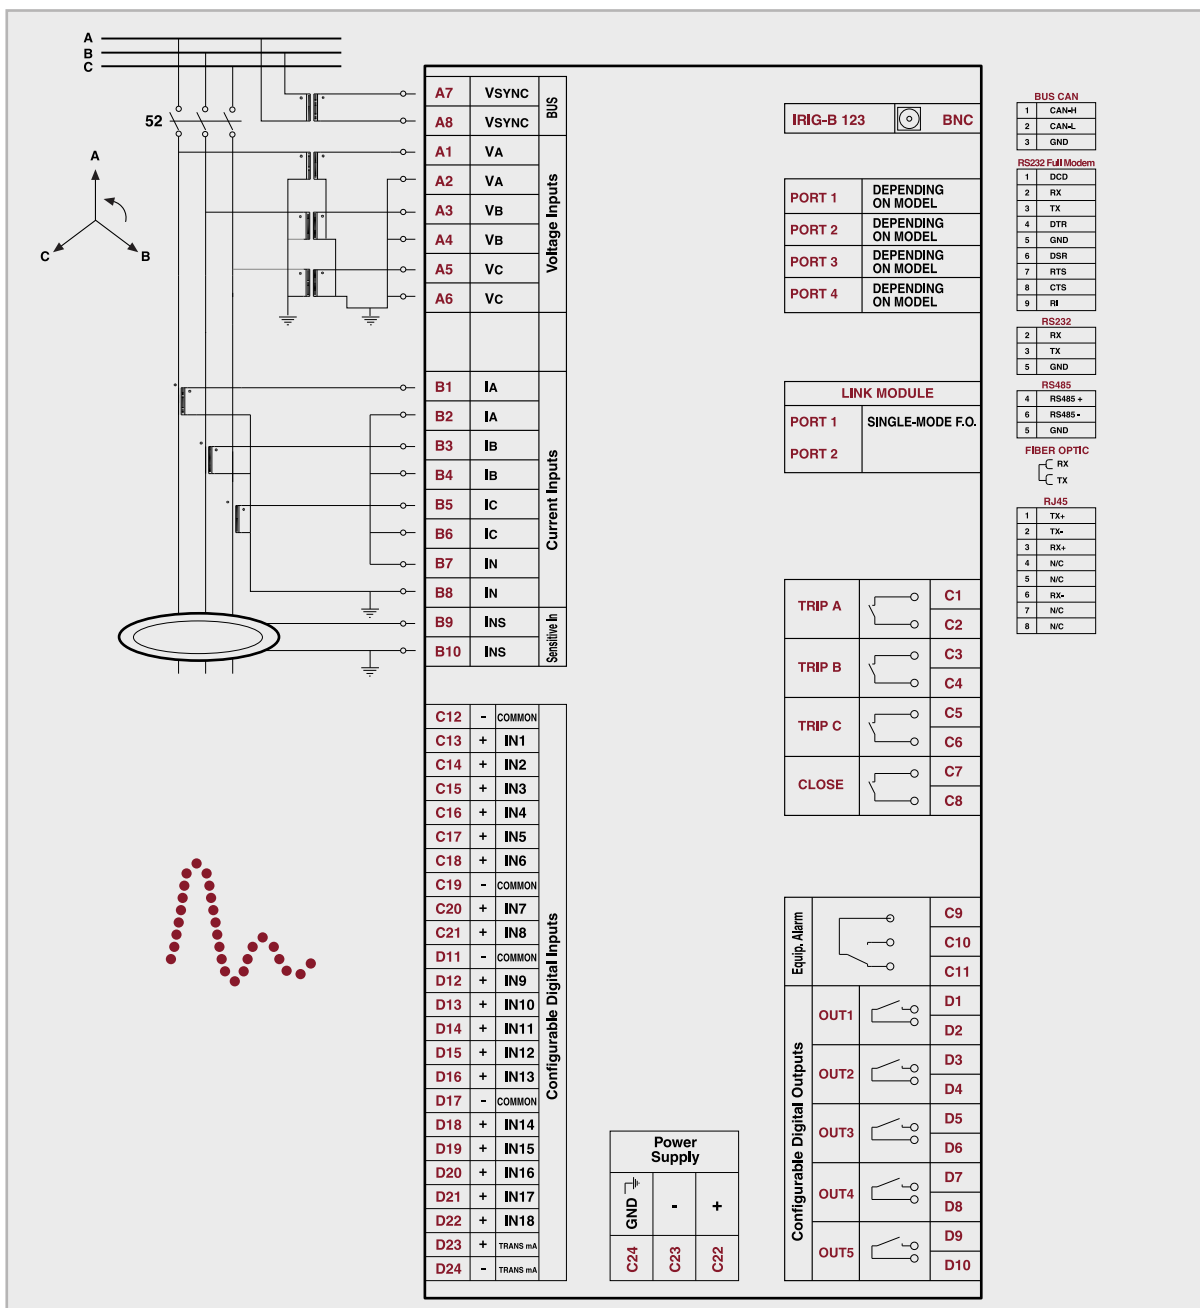

Overcurrent Protection Schemes:

Permissive underreach transfer trip (PUTT), permissive overreach transfer trip (POTT), directional comparison unblocking (DCUB) and directional comparison blocking (DCB). Such protection schemes can be complemented by echo logic or weak infeed logic, and current inversion blocking logic.

Recloser:

The recloser algorithm includes up to four shots programmed in four different modes to create single pole or three pole reclosing cycles based on the type of trip or fault detected.
