# LPC <br> Low Power Coil for self-powered relays 

Self powered relay

> A bistable tripping coil designed to guarantee operation with IRS self-powered relays

Low power coils are a critical component in the tripping chain between a self-powered relay and the circuit breaker driving mechanism.
To guarantee the correct operation of the relay, ZIV offers a bistable linear solenoid which perfectly matches the energy output of the IRS self-powered relay. Its characteristics make this device perfect for the use in applications where both unlocking and locking position are kept for a long time.

## Operation

The coil receives the electric energy from the relay energy output and creates the magnetic field that moves the plunger, transforming electric energy into mechanical energy. Then the tripping mechanism of the circuit breaker is released opening the breaker.
The tripping coil is reset to its locked position by the external force applied by the driving mechanism when closing the circuit breaker.

## Key Features

$\checkmark$ Metal part containing a coil, the core, a magnet system and the fixation holes.
$\checkmark$ Tripping coil working in vertical upwards, vertical downwards and horizontal position

Technical Information

| Nominal Voltage | 17 Vdc |
| :--- | :--- |
| Stroke | $15 \mathrm{~mm}(+5 / 0)$ |
| Spring force start of travel | $>37 \mathrm{~N}, \mathrm{~K}=1.4 \mathrm{~N} / \mathrm{mm}$ |
| Hold force without voltage | $>35 \mathrm{~N}$ |
| Insulation class | $\mathrm{Y}\left(90^{\circ} \mathrm{C}\right)$ |
| Duty cycle at Un (ED) | $80 \%$ |
| Resistance at $\mathbf{2 0} 0^{\circ} \mathrm{C}$ | 16 ohm |
| Protection degree | IP 00 |
